## In the Claims

The following Listing of Claims replaces all prior versions in the application:

## LISTING OF CLAIMS

## 1 - 35. (Canceled)

- 36. (Original) A pFET synapse transistor, comprising:
  - a p- doped substrate;
  - a first n- well and a second n- well disposed in said substrate;
- a first p+ doped region disposed in said first n- well forming a source and a second p+ doped region disposed in said first n- well forming a drain;
  - a channel disposed in said first n- well between said source and said drain;
- a third p+ doped region and a fourth p+ doped region disposed in said second n- well, said third p+ region and said fourth p+ region together forming a tunneling junction;
- a layer of gate oxide disposed above said channel, said first n- well and said second n-well;
  - a polysilicon floating gate disposed above said layer of gate oxide;
  - a source contact terminal electrically coupled to said source;
  - a drain contact terminal electrically coupled to said drain; and
  - a well contact terminal electrically coupled to said second n- well.
- 37. (Original) A pFET synapse transistor in accordance with claim 36, wherein said third

p+ doped region and said fourth p+ doped region are shorted together with a conductive layer which forms a bridge over said floating gate.

- 38. (Original) A pFET synapse transistor in accordance with claim 37, wherein said well contact terminal is strapped to said third p+ doped region and said fourth p+ doped region.
- 39. (Original) A pFET synapse transistor in accordance with claim 38, wherein said transistor is formed with a single layer of conductive polysilicon.
- 40. (Original) A pFET synapse transistor in accordance with claim 36 fabricated using a standard CMOS process.
- 41-43. (Canceled)
- 44. (New) A pFET synapse transistor, comprising:
  - a p- doped substrate;
  - a first n- well and a second n- well disposed in said substrate;
- a first p+ doped region disposed in said first n- well forming a source and a second p+ doped region disposed in said first n- well forming a drain;
  - a channel disposed in said first n- well between said source and said drain;
- a third p+ doped region and a fourth p+ doped region disposed in said second n- well, said third p+ region and said fourth p+ region together forming a tunneling junction;
- a layer of gate oxide disposed above said channel, said first n- well and said second n-well;

- a polysilicon floating gate disposed above said layer of gate oxide;
- a source contact terminal electrically coupled to said source;
- a drain contact terminal electrically coupled to said drain; and
- a well contact terminal electrically coupled to said second n- well,

wherein said synapse transistor is configured to operate as a current source without gate input using a single polysilicon gate layer.

- 45. (New) A system on a chip (SOC) including digital and analog circuits integrated on a single semiconductor chip, the system comprising:
  - a pFET synapse transistor including:
    - a p- doped substrate;
    - a first n- well and a second n- well disposed in said substrate;
  - a first p+ doped region disposed in said first n- well forming a source and a second p+ doped region disposed in said first n- well forming a drain;
    - a channel disposed in said first n- well between said source and said drain;
  - a third p+ doped region and a fourth p+ doped region disposed in said second nwell, said third p+ region and said fourth p+ region together forming a tunneling junction;
  - a layer of gate oxide disposed above said channel, said first n- well and said second n- well;
    - a polysilicon floating gate disposed above said layer of gate oxide;
    - a source contact terminal electrically coupled to said source;
    - a drain contact terminal electrically coupled to said drain; and
    - a well contact terminal electrically coupled to said second n- well.

- 46. (New) A p-channel floating-gate device, comprising:
  - a p- doped substrate;
  - a first n- well and a second n- well disposed in said substrate;
- a first p+ doped region disposed in said first n- well forming a source and a second p+ doped region disposed in said first n- well forming a drain;
  - a channel disposed in said first n- well between said source and said drain;
- a third p+ doped region and a fourth p+ doped region disposed in said second n- well, said third p+ region and said fourth p+ region together forming a tunneling junction;
- a layer of gate oxide disposed above said channel, said first n- well and said second n-well;
- a single polysilicon layer disposed above said layer of gate oxide, said single polysilicon layer comprising a floating gate;
  - a source contact terminal electrically coupled to said source;
  - a drain contact terminal electrically coupled to said drain; and
  - a well contact terminal electrically coupled to said second n- well.
- 47. (New) A system on a chip (SOC) including digital and analog circuits integrated on a single semiconductor chip, the system comprising:
  - a p-channel floating-gate device, including:
  - a p- doped substrate;
  - a first n- well and a second n- well disposed in said substrate;
- a first p+ doped region disposed in said first n- well forming a source and a second p+ doped region disposed in said first n- well forming a drain;
  - a channel disposed in said first n- well between said source and said drain;

- a third p+ doped region and a fourth p+ doped region disposed in said second n- well, said third p+ region and said fourth p+ region together forming a tunneling junction;
- a layer of gate oxide disposed above said channel, said first n- well and said second n-well;
- a single polysilicon layer disposed above said layer of gate oxide, said single polysilicon layer comprising a floating gate;
  - a source contact terminal electrically coupled to said source;
  - a drain contact terminal electrically coupled to said drain; and
  - a well contact terminal electrically coupled to said second n- well.
- 48. (New) A p-channel floating gate device comprising:
  - a p- doped substrate;
  - a first n- well and a second n- well disposed in said substrate;
- a first p+ doped region disposed in said first n- well forming a source and a second p+ doped region disposed in said first n- well forming a drain;
  - a channel disposed in said first n- well between said source and said drain;
- a third p+ doped region and a fourth p+ doped region disposed in said second n- well, said third p+ region and said fourth p+ region together forming a tunneling junction;
- a layer of gate oxide disposed above said channel, said first n- well and said second n-well;
  - a polysilicon floating gate disposed above said layer of gate oxide;
  - a source contact terminal electrically coupled to said source;
  - a drain contact terminal electrically coupled to said drain; and
  - a well contact terminal electrically coupled to said second n- well.

- 49. (New) A p-channel floating gate device in accordance with claim 48, wherein said third p+ doped region and said fourth p+ doped region are shorted together with a conductive layer which forms a bridge over said floating gate.
- 50. (New) A p-channel floating gate device in accordance with claim 49, wherein said well contact terminal is strapped to said third p+ doped region and said fourth p+ doped region.
- 51. (New) A p-channel floating gate device in accordance with claim 50, wherein said transistor is formed with a single layer of conductive polysilicon.
- 52. (New) A p-channel floating gate device in accordance with claim 48 fabricated using a standard CMOS process.
